## INTRODUCTION

Waste printed circuit boards (WPCBs) are the most valuable components of the electrical and electronic equipment wastes, which contain various metallic materials, including precious metals. The concentration of the noble metals, particularly $\mathrm{Au}, \mathrm{Ag}, \mathrm{Pd}$ and Pt is higher than in their primary resources, which makes WPCBs potential sources of recyclable metals. WPCBs contain different hazardous elements, including heavy and toxic metals that may cause significant environmental pollution during the conventional waste treatments by landfilling or incineration. Therefore, the WPCBs recycling is necessary not only for resource recovery, but also for the environmental protection.

In an attempt to develop an innovative and eco-friendly technology for metals recovery from WPCBs, electrochemical dissolution behaviour of $\mathrm{Ag}, \mathrm{Au}, \mathrm{Cr}, \mathrm{Ti}$ was investigated in different bromide-based electrolytes, using electrochemical techniques.

## EXPERIMENTAL

## Corrosion test solutions:

- Sol. A: 2 M KBr
- Sol. B: $2 \mathrm{M} \mathrm{KBr}+0.5 \mathrm{M} \mathrm{HBr}$
- Sol. C: $2 \mathrm{M} \mathrm{KBr}+0.5 \mathrm{M} \mathrm{HBr}+0.01 \mathrm{M} \mathrm{Br}_{2}$

## Electrodes:

- $\mathrm{Au}(1 \mathrm{~mm}) ; \mathrm{Ag}(1.7 \mathrm{~mm}) ; \mathrm{Cr}(3.5 \mathrm{~mm})$ and $\mathrm{Ti}(3 \mathrm{~mm})$ disks as working electrodes
- $\mathrm{Ag} / \mathrm{AgCl} / \mathrm{KCl}_{\text {SAT }}$ as reference electrode (Ref.)
- Pt wire ( $\phi=0.5 \mathrm{~mm}, \mathrm{~L} 10 \mathrm{~cm}$ ) as counter electrode

## RESULTS AND DISCUSSIONS

Open-circuit potential (OCP)

| Metal | $\mathrm{OCP} / \mathrm{V}$ vs. Ag/AgCl/KCI ${ }_{\text {SAT }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | Sol. A | Sol. B | Sol. C |
| Au | +0.036 | +0.450 | +0.614 |
| Ag | -0.236 | -0.230 | -0.113 |
| Ti | -0.262 | -0.002 | +0.738 |
| Cr | -0.232 | n.d. | +0.103 |

Potentiodynamic polarization measurements

Q=Z_{C P E(\omega)}=1 /\left[C(j \omega)^{n}\right] \quad R_{p}=R_{1}+R_{c t}+R_{2}
$$

## CONCLUSIONS

> Except for Cr , which passivates in all studied electrolytes, the corrosion of Au and Ag is significantly enhanced in highly acidic bromide solution, especially in the presence of the oxidizing agent. It allows the generation of the $\mathrm{Br}_{2}-\mathrm{Br}^{-}$system in the $\mathrm{HBr}-\mathrm{Br}_{2}$ solution, which favors the dissolution of Au and Ag at greater rates, as compared to $\mathrm{Br}_{2}$-free electrolytes.
$>$ Ti dissolution rate was also slightly accelerated in the bromide-based solution containing $\mathrm{Br}_{2}$, as proved by EIS measurements.
